Appl. No. 10/536,885 Amdt. Dated 8/31/2005

Amendments to the Specification:

Please replace paragraph [0140] with the following amended paragraph:

[0001] Agrobacterium tumefaciens strain C58pmp90 containing a vector system containing a binary vector system (see, Hellens et al. (2000) "pGREEN: a versatile and flexible Ti vector for Agrobacterium-mediated plant transformation," Plant Molecular Biology 42:819-832) was used for transformation. The vector system included vector pDM containing surB gene, which confers chlorsulfuron resistance, and the gus gene encoding beta-glucuronidase. Bacteria were taken out of frozen glycerol, cultured and maintained on L-Broth medium solidified with 1.5% Bactoagar containing 10 mg/l tetracycline. One day before cocultivation, bacteria were scraped off the solid medium using a loop and suspended in liquid MinAsuc medium and cultured for one day on a shaker (120 rpm) at 28°C. Bacteria concentration was determined, using a spectrophotometer (Beckman DU-50) before cocultivation, and was shown to be 8x108 cells/ml.
